

**Demonstration of BOLLFILTER Corporation Filter System  
Efficacy on Ballast Water Plankton**

**Maritime Environmental Resource Center**

**February 2012**

Maritime Environmental Resource Center  
c/o Chesapeake Biological Laboratory  
University of Maryland Center for Environmental Science  
PO Box 38, Solomons, Maryland 20688, USA

### **Notice**

This evaluation was conducted under specific, predetermined, agreed-upon protocols, criteria, and quality assurance procedures to assess the treatment system's performance.

MERC does not label or list technologies as acceptable or unacceptable but will present the results in an objective way.

MERC and the MERC Advisory Board do not provide certification for technologies, or certify that a technology will always operate as demonstrated. Additionally, no expressed or implied guarantee is provided as to the performance of the technology, or that a technology will always operate at the levels verified. MERC does guarantee the levels verified during the evaluation under the conditions, circumstances, and operations encountered as fully independent and credible.

This report has been reviewed by members of the MERC Advisory Board and provided to BOLLFILTER and MERC funding agencies prior to public release. Mention of trade names or commercial products does not constitute endorsement or recommendation by MERC.

*Questions and comments should be directed to Dr. Mario Tamburri, [tamburri@umces.edu](mailto:tamburri@umces.edu).*

## 1.0. MERC Background and Objectives

The Maritime Environmental Resource Center (MERC) is a State of Maryland initiative that provides test facilities, information, and decision tools to address key environmental issues facing the international maritime industry. The Center's primary focus is to evaluate the mechanical and biological efficacy, associated costs, and logistical aspects of ballast water treatment systems and the economic impacts of ballast water regulations and management approaches. A full description of MERC's structure, products, and services can be found at [www.maritime-enviro.org](http://www.maritime-enviro.org).

To address the need for effective, safe, and reliable ballast water treatment systems to prevent the introduction of non-native species, MERC has developed as a partnership between the Maryland Port Administration (MPA), Chesapeake Biological Laboratory/ University of Maryland Center for Environmental Science (UMCES-CBL), U.S. Maritime Administration (MARAD), Smithsonian Environmental Research Center (SERC), and University of Maryland (UMCP, UMWREC) to provide independent performance testing and to help facilitate the transition of new treatment technologies to shipboard implementation and operations.

The following report describes the evaluation of filter performance for a proof-of-concept demonstration of the potential for the BOLL Automatic Filter Type 6.18.3 to remove ballast water organisms. Detailed protocols and formal MERC Test Plan can be downloaded at [www.maritime-enviro.org](http://www.maritime-enviro.org).

## 2.0. Introduction to BOLLFILTER Technology

The BOLL Automatic Filter Type 6.18.3 system contains bipolar filter candles, which are open at both ends allowing water to flow through from either end during filtration. The filters utilized a 40-micron mesh and a large surface area with a flow capacity of 3,000 m<sup>3</sup> per hour. The system utilizes the bipolar filtration method in conjunction with bipolar backflushing. Rotating flushing arms are fitted both above and below the filter unit. The filter candles are cleaned alternately from above and below with the filtrate fluid without interrupting filtration. The filter housing is compact and made of carbon steel.

## 3.0. Summary of Test Protocols

Five trials were conducted, three in March 2011 and two in June 2011. Water was continuously pumped sea-to-sea, from Baltimore Harbor area (Patapsco River, MD, in the mesohaline region of the Chesapeake Bay) into the US Maritime Administration vessel *MV Cape Washington's* ballast system via the sea chest.

The duration of each trial (from 3 to 6 hours) depended upon a specific filtered volume of 1,000 m<sup>3</sup>, pressure, and flow rate. Water samples were collected before (ambient) and after (post 40 µm) the BOLL filter, then analyzed for total suspended solids (TSS), particulate organic carbon (POC), zooplankton greater than 50 µm (microns), and phytoplankton (10 to 50 µm and 5 to 10 µm). Further details can be found in associated Test Plan.

### 3.1. Test Parameters

Each of the five trials consisted of three sampling periods labeled T-0, T-1 and T-2. Each sampling period was divided into thirds for more intensive sampling of some parameters, and labeled, for example, T0-1, T0-2 and T0-3.

<b>Trial Number</b>	<b>Date</b>	<b>Ave. Back Pressure (psi)</b>	<b>Ave. Flow (m<sup>3</sup>/hr)</b>	<b>Est. No. of Backflushes</b>
BOLL-1	March 16, 2011	30	200	4
BOLL-2	March 17, 2011	30	200	5
BOLL-3	March 24, 2011	30	*200/210	5
BOLL-4	June 1, 2011	25	325	10
BOLL-5	June 2, 2011	24	375	7

\* Flow was increased to 210 m<sup>3</sup>/h prior to sample period T-1.

## 4.0. Trial Results

### 4.1. Water Quality – Physical Parameters

At the beginning of each trial, temperature, salinity and dissolved oxygen were measured in the ambient water using an YSI 556 multi-parameter instrument.

<b>Trial Number</b>	<b>Date</b>	<b>Temp (C°)</b>	<b>Salinity</b>	<b>DO (mg/l)</b>
BOLL-1	March 16, 2011	8.9	6.5	*12.19
BOLL-2	March 17, 2011	8.9	5.2	*11.1
BOLL-3	March 24, 2011	10.7	3.4	11.4
BOLL-4	June 1, 2011	27.7	1.5	6.8
BOLL-5	June 2, 2011	24.6	1.8	3.9

\* These two D.O. readings were obtained from the MD DNR data monitoring program instrument deployed near the Cape Washington at 1 meter in depth.

#### 4.2. Water Quality - Total Suspended Solids (TSS)

Ambient TSS samples were collected at the beginning of each major sampling period (T0, T1, T2). Post-filter TSS samples were collected for every time point (T0-1, T0-2, and T0-3, for example). TSS Mean Detection Limit (MDL) = 2.4 mg/L.

#### 4.4. Zooplankton >50 $\mu\text{m}$

The data below describes the numbers of zooplankton in both the ambient challenge water and after the BOLL filter water during all trials. Size-class distinctions or measures are determined by considering the greatest available measure among the x, y, and z body axis, exclusive of appendages such as legs, swimming appendages, sensory apparatus, or other fine appendages.

The zooplankton communities found during trials 1, 2, and 3 were primarily composed of the calanoid copepod *Eurytemora affinis* in its various life stages. Size class one (>75 $\mu\text{m}$  to <120 $\mu\text{m}$ ) contained the eggs and nauplii, which primarily passed through the filter. While eggs were usually encountered singly, egg clusters when present, were also counted as single objects. Size class two (around 1mm) organisms were largely adult *Eurytemora affinis*. The filter appeared to stop adult calanoid copepods effectively with the exception of run 3 when effectiveness dropped. In addition, barnacle nauplii, rotifers, and several other rare taxa were present in lesser abundance.

The zooplankton communities found during trials 4 and 5 were primarily size class one (>75 $\mu\text{m}$  to <120 $\mu\text{m}$ ) organisms, which were found in both pre- and post-sieve samples in near equal numbers. The dominant species were primarily small rotifers identified as *Brachionus calyciflorus* and *Trichocercas rousseleti*. Although rotifers were nearly as abundant after the filter, many experienced visible damage and may not have survived. Small nauplii of copepods were also found to be abundant in both pre and post sieve samples, even though adult copepods were rare. Bivalve larvae were present in moderate numbers and often passed the filter. The filter generally stopped adult copepods, although some Harpacticoids (smaller than the Calanoids in our samples) were observed in the post filter samples.

#### 4.5. Phytoplankton 10 – 50 µm and 5 – 10 µm

The following two tables describe phytoplankton species composition in both the ambient challenge water and after the BOLL filter water during all test trials.

##### BOLL Trials 1, 2, and 3

Dominant Species	Type	General Size
<i>Skeletonema costata</i>	Diatom (chain forming)	Individual cells 9 – 10 µm
<i>Heterocapsa rotundatum</i>	Dinoflagellate	Approx. 5 – 6 µm
Other Noted Species		
<i>Prorocentrum minimum</i>	Dinoflagellate	22 x 15 µm
<i>Heterocapsa triquerta</i>	Dinoflagellate	24 x 16 µm
<i>Ceratulina pelagica</i>	Diatom (chain forming)	100 x 24 µm (can form larger chains)
<i>Gyrodinium estuariale</i>	Dinoflagellate	15 x 11 µm

##### BOLL Trials 4 and 5

Dominant Species	Type	General Size
<i>Thalassiosira sp.</i>	Diatom (chain forming)	Individual cells 8 – 12 µm
<i>Chaetoceros sp.</i>	Diatom (chain forming)	Individual cells 7 – 15 µm
Other Noted Species (small #)		
<i>Amphidinium sp.</i>	Dinoflagellate	50 x 13 µm
<i>Amphora sp.</i>	Diatom	8 x 30 µm
<i>Asterionella sp.</i>	Diatom (forms star-shaped clusters)	40 x 11 µm
<i>Gonyaulux sp.</i>	Dinoflagellate	24 x 40 µm
<i>Gyrodinium estuariale</i>	Dinoflagellate	15 x 11 µm
<i>Heterocapsa rotundatum</i>	Dinoflagellate	Approx. 5 – 6 µm
<i>Heterocapsa triquerta</i>	Dinoflagellate	24 x 16 µm
<i>Rhizosolenia pungens</i>	Diatom	Varies 4 – 12 diameter; 100+ µm in length
<i>Navicula sp.</i>	Diatom	8 x 30 µm
<i>Scrippsiella sp.</i>	Dinoflagellate	23 x 36 µm
<i>Skeletonema costata</i>	Diatom (chain forming)	Individual cells 9 – 10 µm; can form chains 100+ µm in length
<i>Syndedra sp.</i>	Diatom	Varies 2 – 7 µm diameter 150 – 200 µm in length
<i>Thalassionema sp.</i>	Diatom	Varies 64 µm
<i>Chlamydomonas sp.</i>	Chlorophyceae	7 – 8 µm diameter
<i>Pediastrum sp.</i>	Chlorophyceae (forms star-shaped clusters)	5 – 6 µm
<i>Agmenellum quadruplicatum</i>	Cyanobacteriaceae	

Overall, phytoplankton conditions and cell densities were similar throughout trials 1, 2, and 3. The majority of the phytoplankton were in the 5 to <10  $\mu\text{m}$  category. A strong winter bloom of *Skeletonema costata* and *Heterocapsa rotundatum* occurred during Trials 1, 2, and 3. Chains of *S. costata* were long and healthy; some were in the reproductive phase by presence of auxospores. *H. rotundatum* were also experiencing a winter bloom as noted by high density in the samples and distinctive color and odor of the water during sampling.

A very diverse population of phytoplankton was observed during trials 4 and 5. The dominant species were mostly chain-forming diatoms (*Thalassiosira* sp. *Chaetoceros* sp.). Many phytoplankton species were counted in small numbers along with a few larger dinoflagellates and diatoms. All samples contained large numbers of rotifers (see zooplankton analysis) found to be 3 distinct species.

**5.0 Acknowledgments**

The MERC Testing Team included J. Barnes, T. Mullady, G. Ruiz, G. Smith, D. Sparks, M. Tamburri, M. Wilkinson, and K. Ziombra. We wish thank the crew of the *MV Cape Washington* who provided critical input and support on all aspects of these trials, plus, the Maryland Port Administration and U.S. Maritime Administration for funding and supporting this ballast water filter demonstration.
